**(57) ABSTRACT**

A method of microfiltration of inhaled air for nasal application and product for reducing the risk of inhalation of fine and ultra-fine (i.e., microscopic and submicroscopic) sized atmospheric pollutants by applying a formulation topically to the skin above the upper-lip and in close proximity of the nasal passages. The products of this formulation, when applied, create an electrostatic field for reducing the inhalation of fine and ultra-fine airborne pollutants.

(57) **ABSTRACT**

The present invention relates to a nasal topical application product for restricting the flow of airborne contaminants into a human nasal passage by creation of a proximate, enhanced electrostatic field. This nasal application product includes: (a) a plurality of masses of one or more electrostatic polymers; and, (b) a topical carrier having the plurality of masses dispersed through a portion thereof. At least one of the electrostatic polymers is a poly (dimethyl diallyl ammonium chloride) polymer and is included in the product in an amount of at least 10% by weight, based on the total weight of the polymers and the topical carrier. The nasal application product may be topical solutions, semisolids, spray solutions and vaporizable solutions. Topical applications may be in the form of ointments, pastes, creams and gels. The carrier of the nasal application product of the present invention may be selected from the group consisting of dilutents, volatile spray carriers, lotions, solvents, gels and hydrogels. In some embodiments, substrates, e.g., bandage type substrates, with adhesive on one side and the product polymer(s) and carrier on the opposite side, may be employed.
